

## Memo

*date:* April 28, 2009

*to:* RSC

*from:* D. Beavis 

*subject:* ERL Tests

Tests of the five-cell cavity were conducted at the ERL last week. The cavity produced approximately 20 rad/hr at 1 meter from the cavity inside the blockhouse. The highest level seen outside was 3 mrem/hr at the 1 MW waveguide port. This area is not in its final configuration. Additional testing will be conducted in the future. More surveys on the exterior shielding will be obtained at that time.

The retesting of the cavity will require a small check-off list mainly for checking for posting, ladders, etc.
