

# 15 GeV Low Energy Run

Christoph Montag

February 11, 2014

- First P.S. test ramps Sunday night, 2/9
- Ramping with beam to 100 GeV/n since last night, 2/10
- Got a few 3x3 ramps to flattop in the morning
- Total intensity still limited to six bunches due to 56 MHz RF cavity cooling. Limit hopefully to be lifted later today
- Switched to low energy (7.3 GeV) setup at 11:30 today
- Expect collisions overnight, and Physics tomorrow

- Once DX training quench so far. Expect to need about 5 more quenches; DX training only if followed by an access
- Scheduled 4 h access for PHENIX on Wednesday, 2/19. SIEMENS brushes inspection, possibly other necessary accesses as well
- Maintenance day to coincide with end of low energy run
