Time Meeting

Status

- Removed the Siemens voltage tap on Friday after AGS AC phase loop on. Small intensity drop at AGS extraction, 0.05×10^9 out of two bunches.
- AGS pp development continues with regular Siemens functions since Friday night. Polarization with JQ on is about 62-64% with $2-2.5 \times 10^{11}$. Need to work on remaining emittance growth seen with this setup.
- D15 eIPM was installed last Wednesday. Its commissioning will be one of our task.
- Schedule: pp development finish on May 19. He3 bunch merge in the AGS starts. No NSRL beam that week.

Tiny Difference with High Voltage Tap
