

# **AGS/Booster Status**

Haixin Huang

June 3, 2014  
Time Meeting

# Status

- Au bunch intensity as high as  $2.1 \times 10^9$  has been reached in the AGS extraction lately.
- eIPM TBT measurements taken at AGS injection. Beta function measurements at eIPM have been done. We will do more measurements with eIPM today.
- Wrap up proton work by tomorrow morning(overnight intensity scan and JQ timing scan).
- Helion-Au run starts in two weeks. But we may start injector setup work (test taper sequencer, extraction setup, etc) next week. This requires NSRL to take beam from Tandem starting next week.
