Status

- Polarized proton work was wrapped up last week. We reached two out of three goals for this run: develop a robust JQ timing determination scheme; take vertical emittance measurements with new eIPM. We did not get higher polarization with more scraping in the Booster and more linac input. The emittance growth seems in the Booster. Will work out a plan to deal with emittance growth in the Booster.
- We will push AGS Au intensity in the remainder of the Au-Au running period.
- eIPM work will continue with Au beam.
