# Injector Status

- Provided needed intensities for RHIC operation last week. Current bunch intensity limit in RHIC:  $1.6E11$  for deuteron,  $2.1E9$  for gold.
- Low energy extraction (3.85GeV) setup was done on user7. This is for the coming APEX session tomorrow.
- AGS Beam Loss Monitor system was reviewed last week. The limitation on the last BLM window has been relaxed.
- In the case that we need Au beam from tandem again, the Booster user with Au beam from tandem is still intact.
- Reminder: We would like to check the transverse emittance of proton beam in the AGS before the end of the run. It will happen after RHIC operation is over: June 27-29.
